

## FAQ 38: How do I compare data from parents and children?

What's the issue?

Many studies have shown that there is not always coherence in answers from parents and children when asked about the same thing. For example, parents and children may be asked about the same behavior, but their answers may differ. This is often due to differences in how they perceive the behavior or how they want to respond. It is important to be aware of this when comparing data from parents and children.

## Pitfalls to avoid

There are some issues linked to this kind of data. The comparison between the groups can, of course, be made
